

— TAKE-HOME ASSESSMENT

Technical Assessment

Full-stack voice agent platform & a collection agent for
Goldman Stanley.

DOCUMENT

Technical Assessment

PARTS

Two

ISSUED BY

Lupitor

REFERENCE

LUP-TA-01

Part one of the take home assessment, the prospect is expected to create a full-stack voice agent platform that allows for telephony calling, agent editing, and call observance. Part two of the take home assessment is to make an agent that follows a collection flow for **Goldman Stanley**.

This is purposefully left open-ended. This is a competitive position. The more unique and successful the voice agent, the higher the likelihood of landing the position. We are looking for optimizations that we have not seen before.

01 Create a new project with the following features

- a Voice agent hosting (use livekit)
- b UI that supports the creation and editing of voice agents
- c UI that allows users to see all of the calls that have made for each voice agent
- d DAAS provider of your choice, never clear this database, we want to see how you tested your agents

02 Create a collection voice agent that connects over telephony lines

- a Give the agent uid verification tools
- b Ensure that the user is not able to tamper with the agent to get it to lower the acceptable criteria for minimum amount collected
